A problem of interest

How rates affect investment strategy in 2024

2024 Global Investment Outlook

Higher rates and tighter credit conditions have created **‘a problem of interest’**

In our view, this environment challenges economic and business growth, which is something investors should take note of.

A problem of interest

Higher interest rates and less availability of credit has helped reduce inflation. However, it risks sending economies into recession in the months ahead.

New paradigm

This new economic regime would be very different to the 2010s. Investors should not expect a return to the very low interest rates and abundant availability of credit to fund growth as seen in the previous decade.

Defensive growth

Market consensus shows an expectations for a ‘soft landing’ – where inflation continues to fall back as economies slow, but growth remains positive. Investors should consider defensive strategies in their portfolios to protect against adverse scenarios and think ‘bonds are back’.

Key market themes from the past year

**Higher-for-longer
Interest rate outlook**

**China economic
disappointment**

Disinflation trend

**Artificial
intelligence
boom**

**Developed market
central banks pivot
on interest rates**

**US economic
resilience**

The surprising resilience in the US economy this year has come from the high level of excess savings – the piggy banks consumers built up during the pandemic years – which have continued to support spending. Corporate profits have also been resilient, with firms able to benefit from markups in a higher-inflation environment, and from cash piles earning more interest. Accordingly, US stocks have outperformed. The aforementioned forces are becoming less important now so have delayed a recession, rather than averted one, in our view.

Looking ahead

In our view, inflation data will probably be bumpy, but the broad trend is for inflation to fall back towards central bank inflation targets over 2024.

Our baseline scenario embeds an elevated risk of economic slowdown and unimpressive corporate profits growth. This is somewhat less optimistic than the outlook consistent with current market pricing.

Our inflation scenario means that we expect interest rate cuts in the second half of 2024. We think the US Federal Reserve could surprise the market by cutting rates by more than is currently anticipated – depending on labour market trends.

Looking further ahead, we think there are a number of forces that will keep inflation higher over the medium term versus what we became used to in the 2010s.

Overall, we think we are heading towards a new paradigm, with inflation and interest rates somewhat higher than we were used to during the 2010s. This environment leads us to take a defensive approach in our investment strategy for next year.

Our central scenario

Problem of interest

Macro

West: Tight financial conditions induce economic and corporate profits recession

East: Lacklustre growth continues in China. Japan and India may outperform

Policy

West: Mid-2024 Federal Reserve and European Central Bank interest rate cuts to start. Government spending decline is a mild drag

East: China pursues piecemeal stimulus, and most Asia central banks are lowering interest rates in the second half of 2024

Market

Bonds are back, but other liquid alternative diversifiers lose their shine in 2024

Defensive growth favours selective approach towards higher quality in global bond and equity markets, with an emphasis on country selection

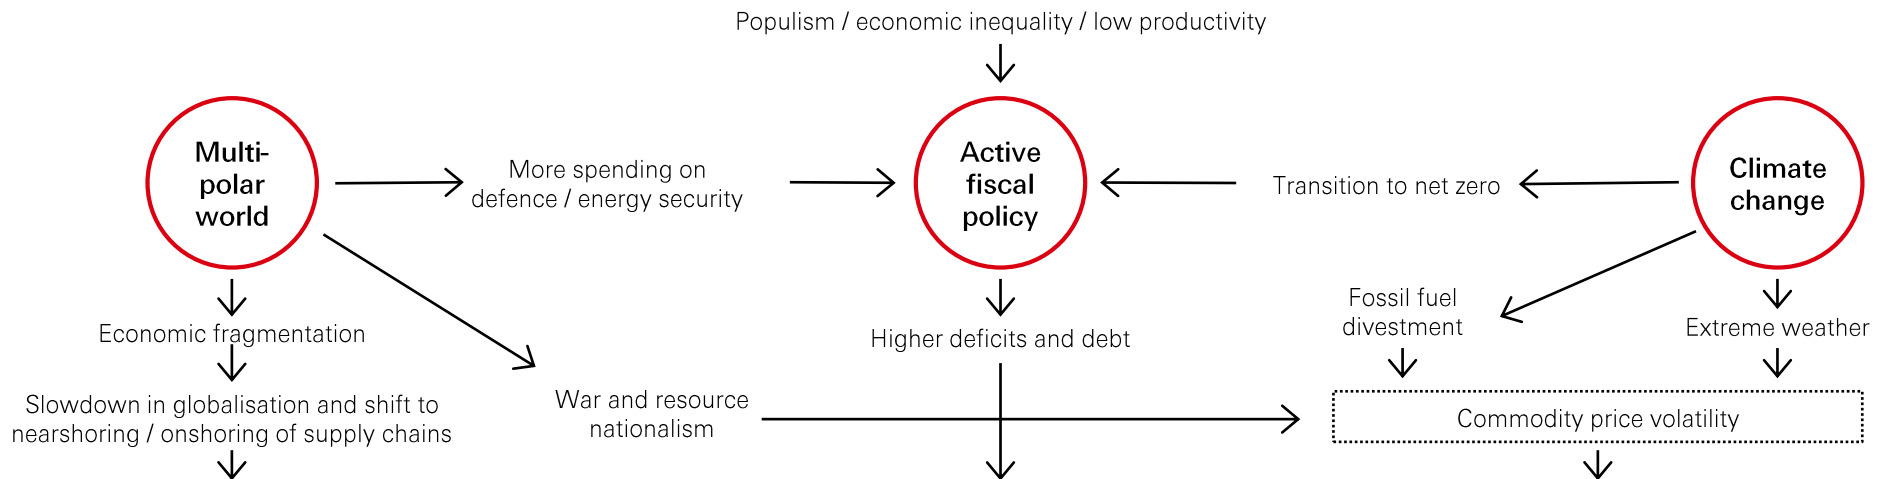

Transitioning to a new paradigm

We think there are three key drivers of the new paradigm:

1. A new, multi-polar world with less cooperation and a retreat from globalisation. This can contribute to higher manufacturing and supply chain costs, and thus inflation.
2. More active government spending driven by political priorities in an age of populism, environmental concerns and high levels of inequality. This contrasts against austerity and budget cuts seen in the previous decade, alongside extensive central bank efforts to stimulate economies back then.
3. Implications from and policies to address climate change and the transition to net zero.

New paradigm means a different economic environment

Emerging markets offer appeal

The current backdrop of rising US interest rates and weaker Chinese economic growth hasn't boded well for emerging markets. However, investment markets take future trends into consideration.

We know that a Federal Reserve rate cutting cycle can be very supportive for emerging markets performance, just like it was in the early 1990s when Fed cuts encouraged a flow of capital into emerging markets.

While history may not repeat itself precisely, the possibility of faster than expected interest rate cuts in the second half of 2024 suggests is one of the factors that investors should closely monitor emerging markets in the coming year.

Valuations matter, and for emerging markets they are generally much lower than those of

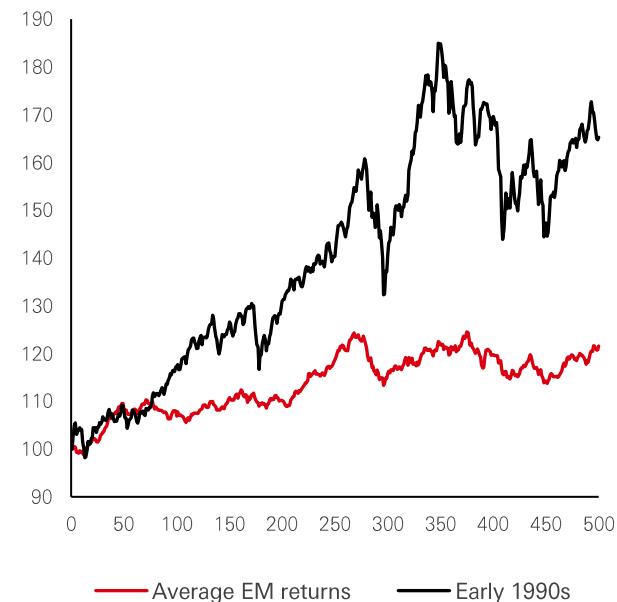

developed markets, and also lower compared to their own history. Based on corporate earnings, the cost of Brazilian stocks, for example, is less than half of its 10-year average.

Importantly, growth stories for individual emerging countries differ, creating diversification within emerging assets. The long-run story in India, for instance – revolving around productivity, digitisation and high-end manufacturing, infrastructure, and a young, growing population – remains strongly intact.

And emerging economies' increasing share of the global economy, alongside demographic advantages, bodes well for broad investment opportunities over the long term.

Emerging markets can perform after the last Federal Reserve rate hike

Portfolios taking shape – defensive growth

Bonds are back

A weaker economy and disinflation should be a supportive environment for government bonds and a challenging one for stocks. In general, we see good opportunities in global fixed income, but emphasize being selective. For example, US treasuries, parts of core European bond markets such as the UK and Germany, and investment grade bonds, generally. Slowing economies increase the risk of defaults by lower quality companies.

For example, US equities are confronted with two challenges necessitating a cautious view, from our perspective. First, earnings growth expectations for next year are high amidst a potential economic slowdown. Second, valuations now appear stretched when compared to yields available from government bond markets.

In comparison, European stocks look compelling, and hence downside could be limited – unless a bad recession materialises.

In our view, we think that Japanese stocks could perform better among developed markets over the short and longer term. Structural tailwinds include rearranging supply changes, new investment in semiconductors, and corporate sector reforms.

Keep an eye on emerging markets

The Federal Reserve cutting interest rates can be very positive for emerging markets performance. Both equity and local bonds should be a part of the investor consideration set.

Divergent stories in equities

Average non-investment grade bond yields exceed historic returns from equity
